📘 1. IUPAC NOMENCLATURE (ADVANCED LEVEL)

1. Parent Chain Selection (TRAPS ⚠️)

Longest chain ≠ always correct

Priority:

Maximum functional group

Maximum multiple bonds

Maximum length

👉 Example trap: Shorter chain with FG > longer chain without FG

2. Numbering Priority (CRITICAL)

Order:

Functional group

Multiple bond (double > triple)

Substituent

👉 Tie case:

Double bond gets lower number than triple

3. Complex Substituents

Branched substituent → bracket me likho

Edit with WPS Office

Numbering substituent ke andar se start

Example: (1-methylethyl), (tert-butyl)

4. Special Naming Cases

Bicyclic compounds → bicyclo[a.b.c]

Spiro compounds → spiro[x.y]

5. Functional Group Priority (ADV LEVEL)

COOH > SO3H > anhydride > ester > acyl halide > amide > CN > aldehyde > ketone > alcohol > amine

👉 *Important trap:*

Double/triple bond suffix me aata hai but FG se niche priority

Edit with WPS Office
